Energy Concept – The Energy Strategy

› By 2020:

- › - **40%** Green House Gas (**GHG**) emissions compared with 1990 levels
- › - **20%** Primary Energy Demand (**PED**) compared with 2008 levels

› By 2050:

- › - **80%** Green House Gas (**GHG**) emissions compared with 1990 levels
- › - **50%** Primary Energy Demand (**PED**) compared with 2008 levels

› Balance energy efficiency and renewables

Energy Concept – Part “Buildings”

- › **By 2020**
 - › - **20% Heat Demand**
- › **By 2050**
 - › - **80% PED in buildings**
 - › **existing building stock to be “almost climate neutral” (by reducing heat demand and heating based on renewables)**
- › Improving the quality of energy-efficient measures
- › Technical reality: We are already building in accordance with these highly efficient standards today!

German Government Coalition Agreement

- › **Continuation and increased funding** for the CO₂-Rehabilitation Programme – KfW Programmes
- › Strengthening of Energy Consulting

E. Energy upgrades for buildings and energy-efficient new buildings

Buildings account for about 40% of final energy consumption in Germany and about a third of CO₂ emissions. At the same time, there is tremendous potential for saving energy and cutting CO₂. Three quarters of Germany's existing building stock was built before the first Thermal Insulation Ordinance was adopted in 1979. Many of these buildings have had little or no work performed to upgrade their energy performance. The overwhelming majority of heating systems lag behind the state of the art. The scenarios show that upgrading the building stock's energy performance is the central key to modernising our energy supply and achieving our climate protection targets.

Our central objective is therefore to reduce the heating requirement of our building stock over the long term, and the target for 2050 is to have a building stock which is almost climate-neutral. Climate-neutral means that buildings have very low energy needs, and the remaining energy demand is covered primarily by renewable sources. That means doubling the rate of building renovation to upgrade energy performance from approximately 1% to 2% per annum. By 2020 we want to reduce the heating requirement by 20%. Furthermore, by 2050 we aim to reduce primary energy demand by an order of magnitude of 80%. In 2020 the targets and measures are to be evaluated against the background of the results that have been achieved by then.

Upgrading the energy performance of buildings is the most significant action in sustainably cutting back the use of fossil energy sources and decreasing our dependence on energy imports. This will not come free of charge, but will require considerable

investments, although in the long run that will save costs. Implementing this strategy will require suitable and reliable legal framework conditions, time and money. That explains the need for a long-term road map for energy upgrades which offers those concerned a framework to guide investment and also the flexibility they need.

The existing instruments will not suffice to meet those targets. The Energy Saving Ordinance (EnEV) specifies requirements for new buildings and for the renovation of existing stock. The Renewable Energies Heat Act (EEWärmeG) was also designed for new buildings. These instruments must be updated to achieve renovation targets, to the extent that this is economically feasible.

However, experience to date also shows that there are limits to the application of government regulations – especially with regard to existing stock – when it comes to the economic strain that owners can be expected to bear. Business as usual, based on the current mix of instruments, will not help us forward. A new strategic approach is needed to take advantage of the technical and commercial opportunities presented by energy upgrades to existing buildings. In future it will be crucial, in the owners' interests, to define the long-term renovation requirement so that owners can take this into account in investment planning. We want to create incentives, not order compulsory renovation. Economic incentives are at the heart of our policy, not telling our citizens what to do. Against this background, the German government will draw up a concept for a long-term road map for building renovations.

Energy-efficient buildings by 2050

The core components of this “modernisation campaign” for buildings are as follows:

- The 2012 amendment to the Energy Saving Ordinance will introduce the “climate-neutral building” standard for all new buildings by 2020, based on primary energy indicators. The renovation road map for existing buildings will start in 2020, leading in stages to the target of an 80% reduction in primary energy demand by 2050. The principle of economic viability must be observed in this context.

Key principles for CO₂-Rehabilitation Programme – KfW-Programmes

› German Energy Saving Ordinance (EnEV)

- › Promotional programmes are based on legal framework
- › Incentives require higher efficiency standard than legal framework

› Promotional Programmes are focused on a holistic approach

- › Focusing on energy efficiency and renewable energies
- › Free choice of technology (heating system and building envelope)
- › Cost efficiency and reduction of energy consumption are crucial

› KfW-Efficiency House: brand for energy-efficiency

- › Technological standard for new and existing buildings
- › Easy to understand: the smaller the number the higher the energy efficiency

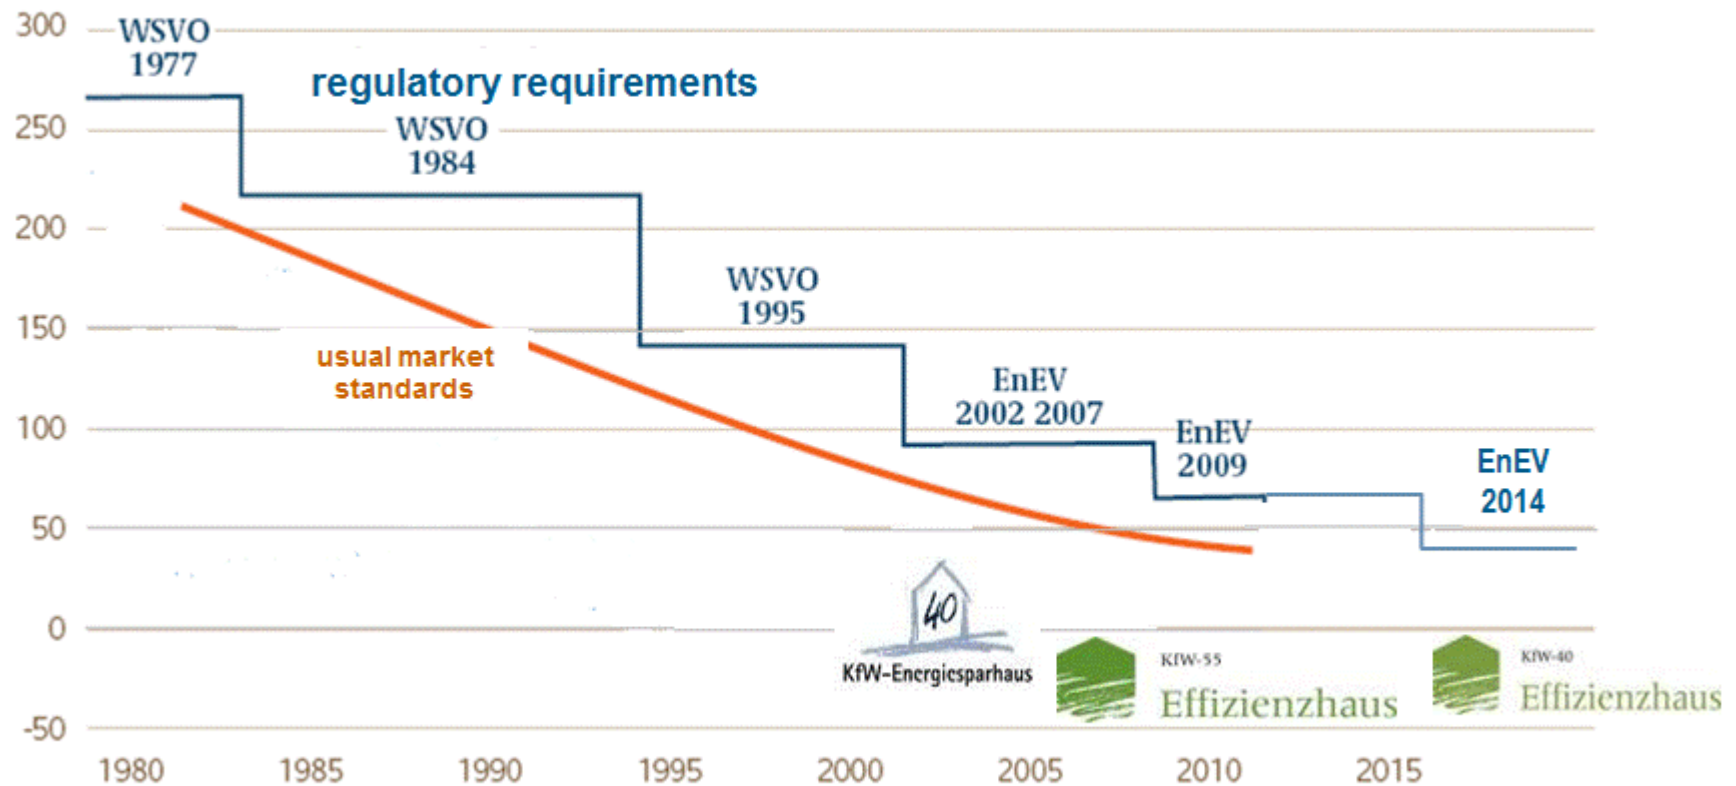

› The higher the energy efficiency, the higher the promotional incentives

Development of energy-efficiency standards

Primary Energy Demand (PED) for Heating [kWh/m²a] e.g. one-family house

source: KfW / IBP, Erhorn

German Energy Savings Regulations (EnEV 2009)

- › Energy standards for the construction and the energy-efficient retrofitting of residential and non-residential buildings:
 - › with regard to the envelope
 - › with regard to heating, cooling and air conditioning techniques as well as warm water
- › Determines calculation methods
- › Regulation for Energy Performance certificates

German Energy Savings Regulations (EnEV 2014)

- › Control system for energy performance certificates
- › Introduction of Low-Energy Building Standard or Zero Energy Building (ZEB) (Art. 9 EPBD)
- › Energy indicator for property advertisements
- › Proportion of renewable energy in energy performance certificates for new build
- › Primary energy indicators for all energy performance certificates

CO₂-Rehabilitation Programme (KfW-Programmes)

Commitment Volumes since 2006

CO₂-Rehabilitation Programme (KfW-Programmes)

Results 2006 – march 2014

- › more than 3.5 million housing units were refurbished or newly erected
- › nearly **50% of new residential buildings** and **33% of refurbished buildings** are cofinanced by CO₂-rehabilitation programme
- › nearly 1,940 buildings of cities, municipalities and social institutions were cofinanced
- › **€ 11,1 billion federal funds** (2006 – 2013) generated a
 - › **total investment** of around **€ 162 billion**
 - › 1 € public funding effects 12 € private investments in average per year
- › climate will benefit due to **less GHG-emissions of 7.1 mio. t per year** (for an estimated 30 years lifespan of measures)
- › **Energy efficiency benefits all**
 - › saving of heating costs for tenants
 - › tenants live in a more comfortable home
 - › increase of market value of building
 - › Energetic modernisation combined with maintenance measures are often economical
 - › less-dependence on energy

Federal Ministry
for Economic Affairs
and Energy

CO₂-Rehabilitation Programme (KfW-Programmes)

- › investments in energy efficiency create and safeguard annually up to 300,000 jobs in the small and medium-sized construction industry, 2013 up to 440,000 jobs
- › **additional budget** of taxes and social security contribution as well as reducing costs of unemployment (expertise of Forschungszentrum Jülich, Germany) by **reliefs to the public budget** of about **€ 4 to € 5 by each €**
- › energy-efficient refurbishment and erection of „KfW-Efficiency Houses“ demand **further training** of
 - › architects and civil engineers
 - › engineers for heating etc.
 - › energy consultants
 - › skilled employees of construction industry

Lessons

- › The more transparent and simple the promotional scheme ...
 - › the better it is to understand and
 - › the easier it is to distribute
- › The mandatory involvement of an energy expert is very important to
 - › provide comfort to the investor regarding his energy efficiency project
 - › assure a high degree of quality and reliability regarding energy efficiency level reached
 - › assure target-oriented use of public funds and
 - › assure high degree of reliability regarding the promotional effects
- › Monitoring of promotional effects is important to show
 - › economic and climatic impact
 - › contribution to fulfill the goals of the Federal Government
